Autocorrelation Function

INTRODUCTION TO TIME SERIES ANALYSIS IN PYTHON

Rob Reider

Adjunct Professor, NYU-Courant Consultant, Quantopian

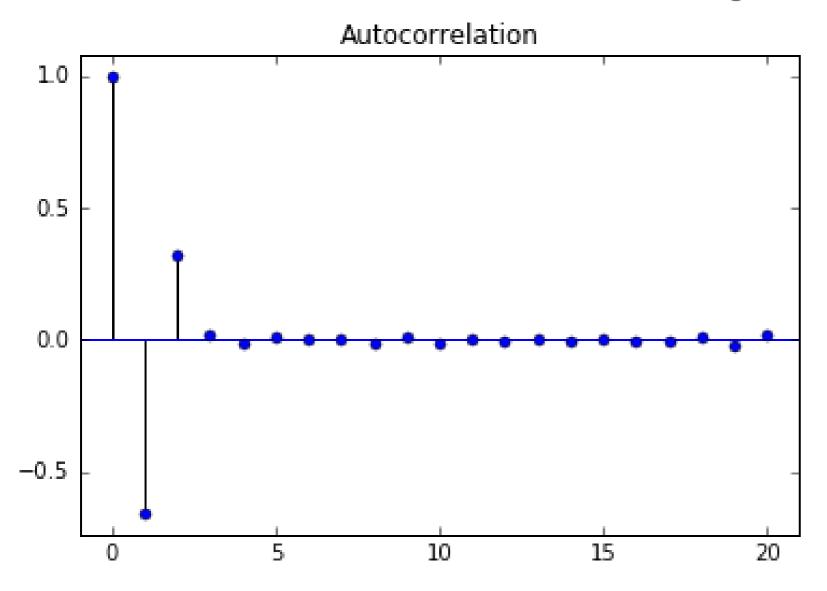

Autocorrelation Function

- Autocorrelation Function (ACF): The autocorrelation as a function of the lag
- Equals one at lag-zero
- Interesting information beyond lag-one

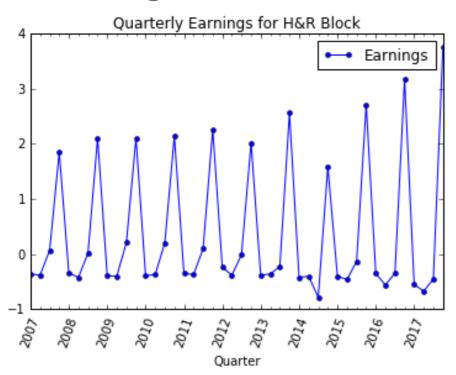

ACF Example 1: Simple Autocorrelation Function

Can use last two values in series for forecasting

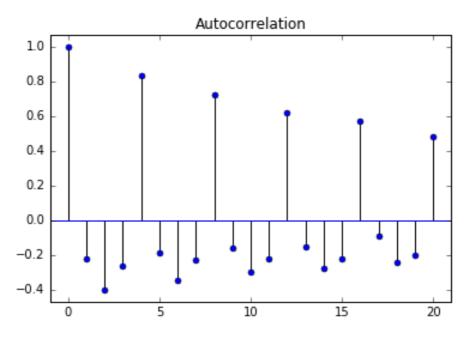

ACF Example 2: Seasonal Earnings

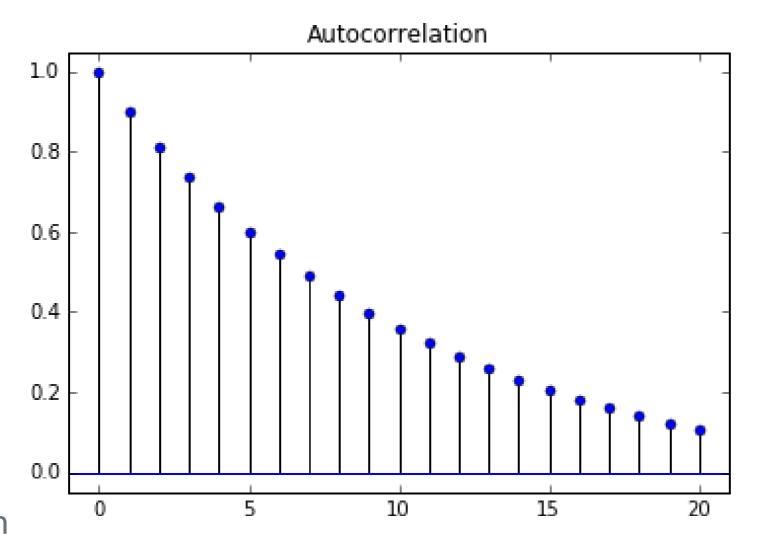

Earnings for H&R Block

ACF for H&R Block

ACF Example 3: Useful for Model Selection

Model selection

Plot ACF in Python

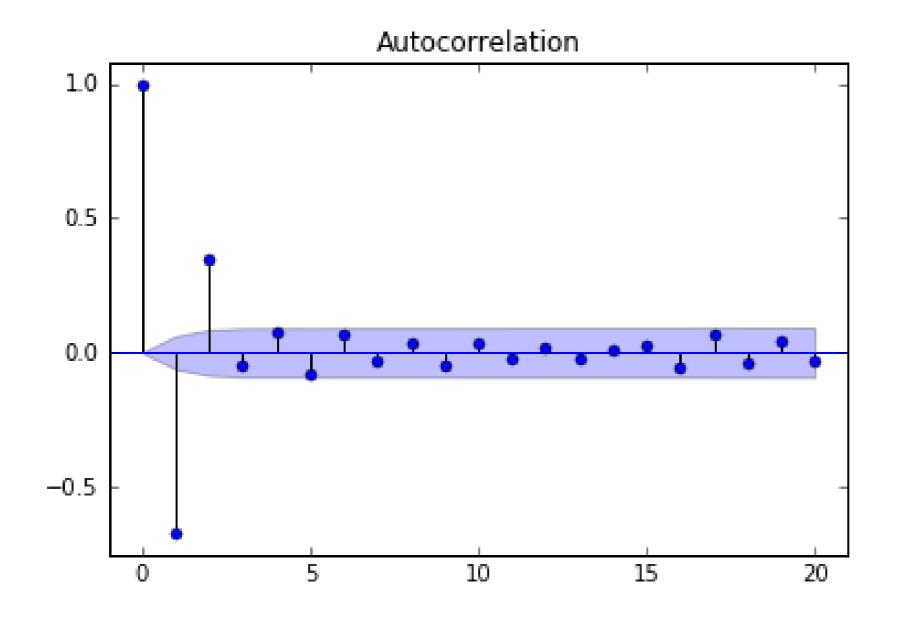

Import module:

```
from statsmodels.graphics.tsaplots import plot_acf
```

Plot the ACF:

```
plot_acf(x, lags= 20, alpha=0.05)
```

Confidence Interval of ACF

Confidence Interval of ACF

- Argument alpha sets the width of confidence interval
- Example: alpha=0.05
 - 5% chance that if true autocorrelation is zero, it will fall outside blue band
- Confidence bands are wider if:
 - Alpha lower
 - Fewer observations
- Under some simplifying assumptions, 95% confidence bands are $\pm 2/\sqrt{N}$
- If you want no bands on plot, set alpha=1

ACF Values Instead of Plot

```
from statsmodels.tsa.stattools import acf
print(acf(x))
```

```
      [ 1.

INTRODUCTION TO TIME SERIES ANALYSIS IN PYTHON

White Noise

INTRODUCTION TO TIME SERIES ANALYSIS IN PYTHON

Rob Reider

Adjunct Professor, NYU-Courant Consultant, Quantopian

What is White Noise?

- White Noise is a series with:
 - Constant mean
 - Constant variance
 - Zero autocorrelations at all lags
- Special Case: if data has normal distribution, then Gaussian White

Noise

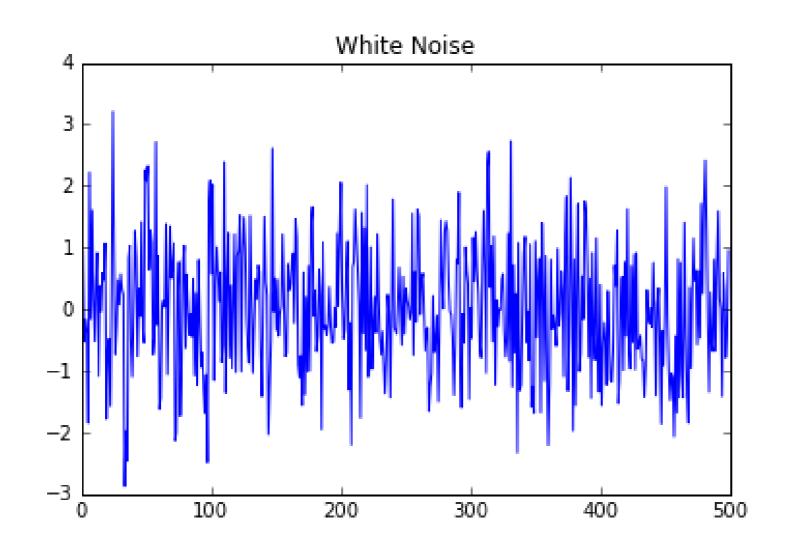

Simulating White Noise

• It's very easy to generate white noise

```
import numpy as np
noise = np.random.normal(loc=0, scale=1, size=500)
```

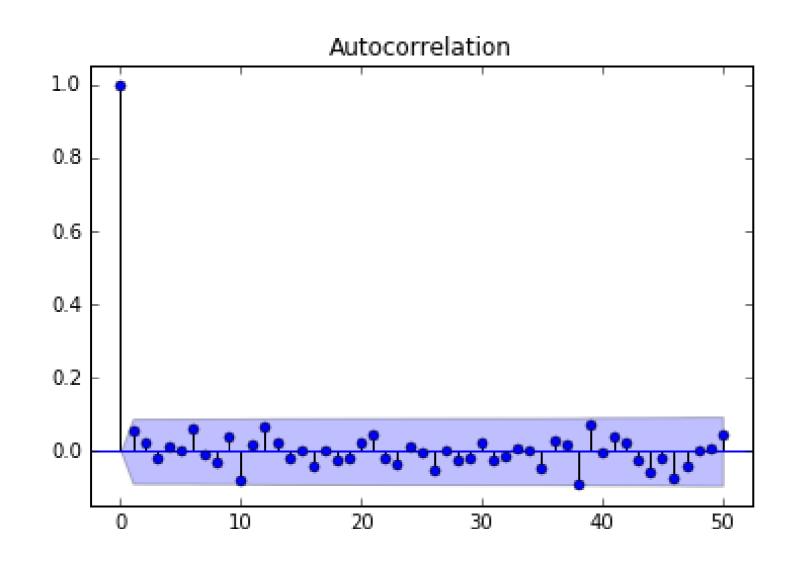

What Does White Noise Look Like?

plt.plot(noise)

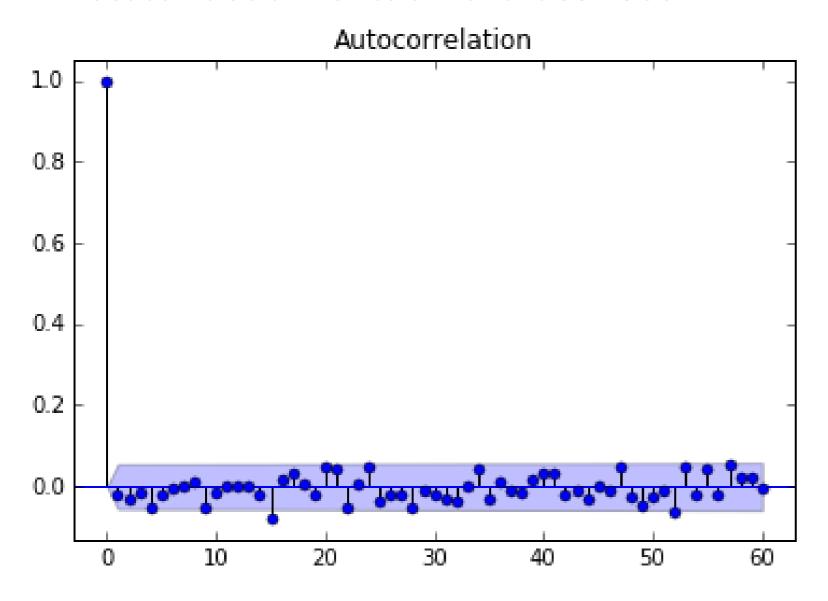

Autocorrelation of White Noise

plt_acf(noise, lags=50)

Stock Market Returns: Close to White Noise

Autocorrelation Function for the S&P500

Let's practice!

INTRODUCTION TO TIME SERIES ANALYSIS IN PYTHON

Random Walk

INTRODUCTION TO TIME SERIES ANALYSIS IN PYTHON

Rob Reider

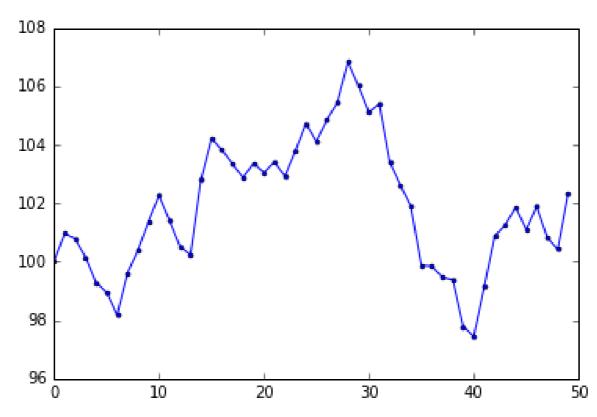

Adjunct Professor, NYU-Courant Consultant, Quantopian

What is a Random Walk?

Today's Price = Yesterday's Price + Noise

$$P_t = P_{t-1} + \epsilon_t$$

• Plot of simulated data

What is a Random Walk?

Today's Price = Yesterday's Price + Noise

$$P_t = P_{t-1} + \epsilon_t$$

Change in price is white noise

$$P_t - P_{t-1} = \epsilon_t$$

- Can't forecast a random walk
- Best forecast for tomorrow's price is today's price

What is a Random Walk?

Today's Price = Yesterday's Price + Noise

$$P_t = P_{t-1} + \epsilon_t$$

Random walk with drift:

$$P_t = \mu + P_{t-1} + \epsilon_t$$

Change in price is white noise with non-zero mean:

$$P_t - P_{t-1} = \mu + \epsilon_t$$

Statistical Test for Random Walk

Random walk with drift

$$P_t = \mu + P_{t-1} + \epsilon_t$$

Regression test for random walk

$$P_t = \alpha + \beta P_{t-1} + \epsilon_t$$

• Test: $H_0: eta=1$ (random walk) $H_1: eta<1$ (not random walk)

Statistical Test for Random Walk

Regression test for random walk

$$P_t = \alpha + \beta P_{t-1} + \epsilon_t$$

Equivalent to

$$P_t - P_{t-1} = \alpha + \beta P_{t-1} + \epsilon_t$$

• Test: $H_0: eta=0$ (random walk) $H_1: eta<0$ (not random walk)

Statistical Test for Random Walk

Regression test for random walk

$$P_t - P_{t-1} = \alpha + \beta P_{t-1} + \epsilon_t$$

- Test: $H_0: eta=0$ (random walk) $H_1: eta<0$ (not random walk)
- This test is called the **Dickey-Fuller** test
- If you add more lagged changes on the right hand side, it's the

Augmented Dickey-Fuller test

ADF Test in Python

Import module from statsmodels

from statsmodels.tsa.stattools import adfuller

Run Augmented Dickey-Test

adfuller(x)

Example: Is the S&P500 a Random Walk?

```
# Run Augmented Dickey-Fuller Test on SPX data
results = adfuller(df['SPX'])
# Print p-value
print(results[1])
0.782253808587
# Print full results
print(results)
(-0.91720490331127869,
 0.78225380858668414,
 0,
 1257,
 {'1%': -3.4355629707955395,
  '10%': -2.567995644141416,
  '5%': -2.8638420633876671},
```

Let's practice!

INTRODUCTION TO TIME SERIES ANALYSIS IN PYTHON

Stationarity

INTRODUCTION TO TIME SERIES ANALYSIS IN PYTHON

Rob Reider

Adjunct Professor, NYU-Courant Consultant, Quantopian

What is Stationarity?

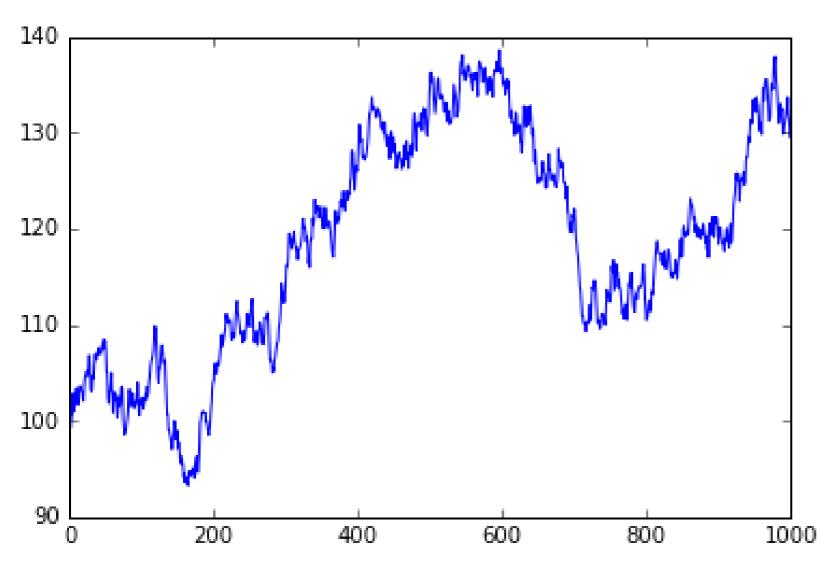

- Strong stationarity: entire distribution of data is time-invariant
- Weak stationarity: mean, variance and autocorrelation are time-invariant (i.e., for autocorrelation, $corr(X_t, X_{t-\tau})$ is only a function of au)

Why Do We Care?

- If parameters vary with time, too many parameters to estimate
- Can only estimate a parsimonious model with a few parameters

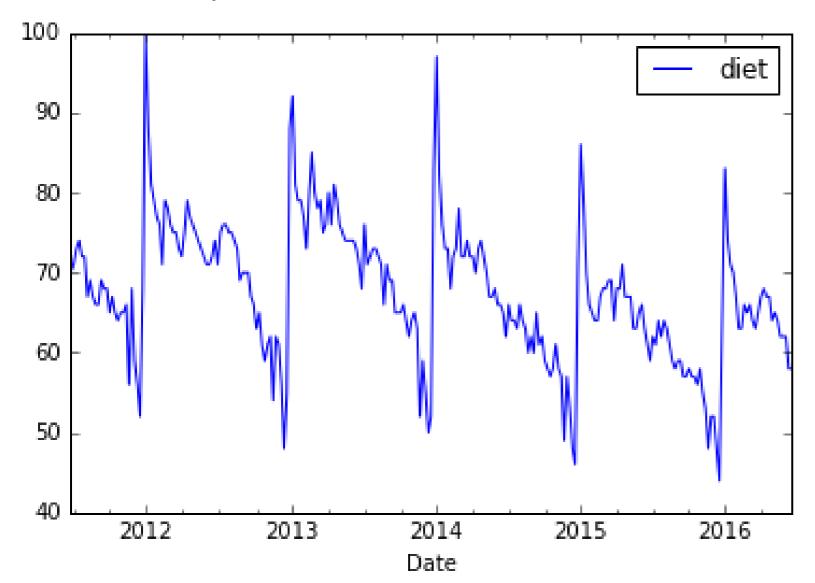

Examples of Nonstationary Series

Random Walk

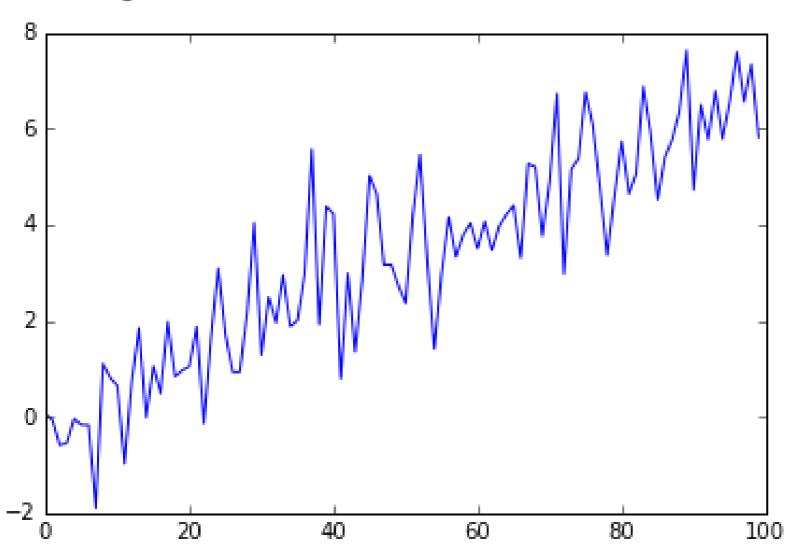

Examples of Nonstationary Series

Seasonality in series

Examples of Nonstationary Series

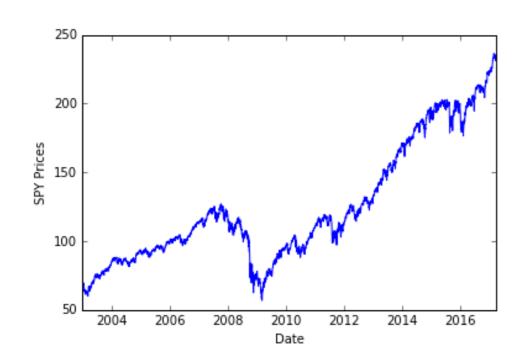

Change in Mean or Standard Deviation over time

Transforming Nonstationary Series Into Stationary Series

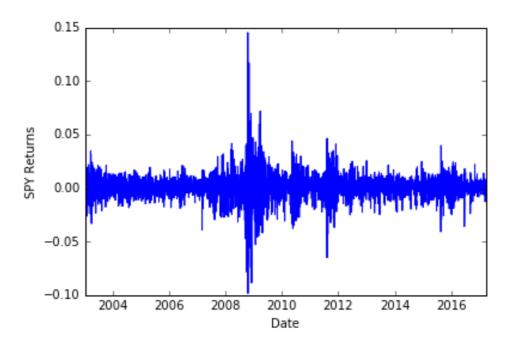

Random Walk

plot.plot(SPY)

First difference

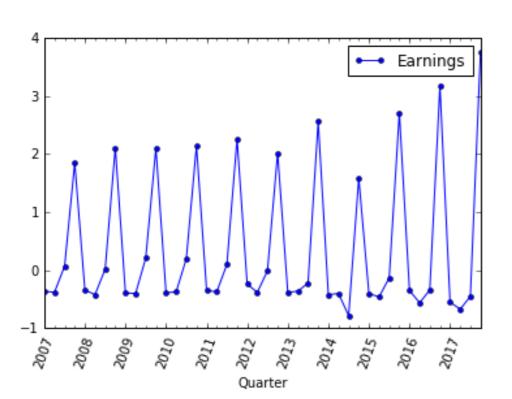

plot.plot(SPY.diff())

Transforming Nonstationary Series Into Stationary Series

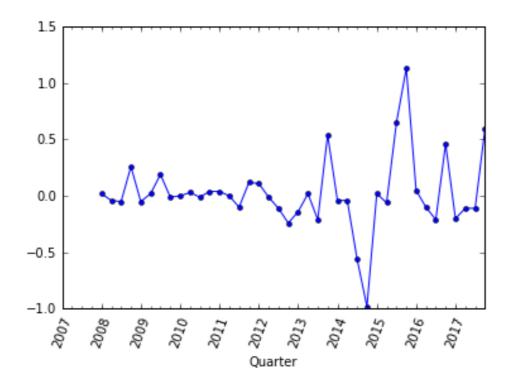

Seasonality

plot.plot(HRB)

Seasonal difference

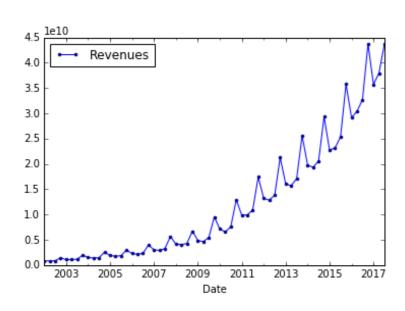

```
plot.plot(HRB.diff(4))
```

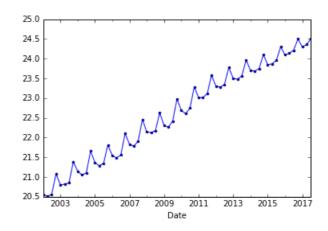

Transforming Nonstationary Series Into Stationary Series

AMZN Quarterly Revenues

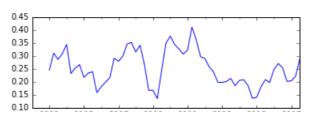

plt.plot(AMZN)

```
# Log of AMZN Revenues
plt.plot(np.log(AMZN))
```

```
# Log, then seasonal difference
plt.plot(np.log(AMZN).diff(4))
```
